CAULDRON TECHNOLOGIES, INC.

Phase 1A Acceptance Certificate

CAUL AI — Cauldron Growth OS Command Center (Private Enterprise Platform)

This certifies that **Phase 1A** of the CAUL AI Command Center has been delivered, independently tested, and **formally accepted** by the Executive Owner. The platform operates as a standalone, private, PostgreSQL-backed system of record with **no external service connectivity and $0 external spend**. Authentication runs as a clearly labeled provider-neutral **stub**; all connectors remain **Not Connected**.

Program	CAUL AI — Phase 1A	**Acceptance Date**	13 October 2026
Exec Owner	Sean Gaden	**Status**	**ACCEPTED — CLOSED**
Datastore	PostgreSQL 15 (dev + staging)	**External Spend**	$0

Scope & Controls Delivered

- Provider-neutral OIDC/OAuth2 auth interface + labeled stub; JWT httpOnly sessions, server-side expiry/revocation
- Recommendation & approval state machines with digest binding, quorum, no self/expired/service-identity approval
- Emergency controls: global/granular pause-resume, queue cancel/drain, revoke, rollback (stub paths)
- Connector contract-test suite (StubConnector); all live connectors remain Not Connected
- Server-side RBAC, default-deny; complete resource×action matrix; CI-enforced route coverage
- Tamper-evident hash-chained audit; INSERT-only at DB level; canonical sequencing + verify + checkpoints
- Separate physical dev/staging databases; least-privilege app user; idempotent seed with production guards
- Full Command Center UI, all states, responsive, WCAG 2.1 AA

Test & Security Evidence

Automated test suite	44 / 44 pytest passed (RBAC, audit, adversarial, route-coverage, seed-guard, connector-contract, hardening)
Audit integrity	Hash chain CHAIN VERIFIED — 0 issues at acceptance
Security remediations	CORS allowlist (no wildcard); CSRF middleware; rate limiting; BOLA ownership checks; env-specific cron HMAC
Session cookie	HttpOnly; Secure; SameSite=Lax; server-side revocable; CSP frame-ancestors 'none'; HSTS; X-Frame-Options DENY
Accessibility	WCAG 2.1 AA UI remediation + manual screen-reader review pass

Explicit Boundaries (Deferred to Phase 1B — requires separate written approval)

Auth0 / live IdP connection • true separate-server infrastructure isolation • activation of real connectors • off-box checkpoint export • any production environment or external integration. None of the above were enabled in Phase 1A.
