Deal Flow OS — Access & Approval Request (for CAUL AI Phase 1 readiness)

From: Cauldron Technologies, Inc. / CAUL AI engineering
To: Deal Flow OS owner / administrator
Purpose: Enable a limited, **staging-only, read-only** metrics connector from CAUL AI. This request is for **authorized discovery + a scoped staging credential only.** No production changes, no customer-record access, no spend.

> Deal Flow OS will **not** take any runtime dependency on CAUL AI. Everything requested is read-only and aggregate-only.

A. Executive approval (required to start Phase 1)

- [ ] Written approval to begin a **staging-only** Phase 1 connector.
- [ ] Confirmation that production remains **out of scope** until a separate, tested, approved rollout.

B. Read-only discovery access (for the authorized audit)

- [ ] Tech stack & repository (framework, language, DB engine).
- [ ] Hosting, monitoring, and deployment workflow (names only; no secrets).
- [ ] Authentication method (how services/users authenticate).
- [ ] Existing public/internal **APIs** + versioning + rate limits.
- [ ] **Billing/analytics source of truth** (e.g., Stripe? internal tables?).
- [ ] Webhook capability (yes/no) and tenant model (single vs. multi-tenant).

C. Scoped staging credential (least-privilege)

- [ ] A **read-only service token** issued in **Deal Flow OS staging** (not production).
- [ ] Scoped to **aggregate metrics only** — no row-level/PII access.
- [ ] Rotatable + revocable; short TTL acceptable.
- [ ] Delivered via a secure channel (never in chat/email plain text).

D. Metrics source-of-truth confirmation (fill-in)

For each metric: confirm **source**, **formula**, and **refresh cadence**.

Metric	Source of truth	Formula	Cadence
Registered accounts			
Active accounts			
Paying subscribers			
MRR / ARR			
New subscriptions			
Cancellations / churn			
Trial -> paid conversion			
Activation			
Feature adoption			
Acquisition cost (CAC)			

E. CAUL AI trust-model decision (pick one)

- [ ] **Option 1:** Stand up CAUL AI production IdP first (Phase 1B), then integrate.
- [ ] **Option 2:** Interim **signed service-token** for **staging-only** Phase 1, IdP decided later.

What CAUL AI will build once A–E are granted (staging only)

A versioned **read-only** `/v1/metrics/*` consumer: scheduled pull, timeouts + bounded retries + circuit breaker, aggregate-only validation, audit on every fetch, and a kill switch (emergency pause scope `connector:dealflow`). Deal Flow OS exposes a new **read-only** aggregate metrics endpoint in **staging**; no other Deal Flow OS changes.

What CAUL AI will NOT do

Modify/deploy Deal Flow OS production · run migrations · merge databases · read customer/seller/buyer/transaction records · create paid services · generate production credentials · trigger outreach or spend.

Return this completed checklist + the staging credential to proceed to a scoped, staging-only Phase 1.
